1. Important notices

Safety and warning symbols:

Danger

Information and safety notices

Non-observance of these safety instructions and warnings can result in personal injury !

2. Functional description for magnetic stirrer couplings

Magnetic stirrer couplings are used for stirring tasks under vacuum and high pressure. Stirring shaft rotation is achieved by magnetic coupling without any physical contact, so no moving parts require sealing. The size of the magnetic stirrer coupling shall be selected according to the viscosity, volume and temperature of the medium to be stirred. Magnetic stirrer couplings can be used with any drive motor in consideration of the speed allowed. The drive shaft is equipped with ball bearings which minimise the driving load of the motor. The output shaft is, according to the type, equipped with slide or ball bearings. Chemical resistance corresponds to the generally valid resistance lists of the material producers.

3. Use for the intended purpose

Magnetic stirrer couplings are gastight and vacuum-tight and are suitable, according to the type, for pressures up to 700 bar and temperatures up to 550°C. Different bearings and/or construction materials are offered to accommodate almost any application requiring chemical resistance. The specifications in this technical documentation and on the type label need to be observed.

3.1 Magnetic stirrer couplings with ground joint

The NS types are offered with NS ground joint and are particularly suitable for pressureless applications using glass reaction vessels. Stirring shafts made from stainless steel and glass may be fitted. NS ground joint types may only be used for pressureless or vacuum applications. Specific technical data can be found in the technical data sheet of these operating instructions and on the type label.

3.2 Magnetic stirrer couplings with flange

The F types with flange are suitable for a pressure up to 10 bar. Stirring shafts made from stainless steel and glass may be fitted. Specific technical data can be found in the technical data sheet of these operating instructions and on the type label.

3.3 Magnetic stirrer couplings with thread

The G types with M30x2 thread connection are designed to be used on high pressure reactors (stirring autoclaves). Depending on the construction material, they are suitable for pressures up to 200 bar (material nos. 1.4435, 2.4602) or up to 700 bar (material no. 1.4980) and a maximum temperature of 300°C.

The Mini types have an M18x1 thread connection and are suitable for high pressure reactors (stirring autoclaves). Depending on the material, they can be used for pressures up to 300 bar (mat.no. 1.4435) or up to 700 bar (mat.no. 1.4980) and a temperature up to 200°C.

Specific technical data can be found in the technical data sheet of these operating instructions and on the type label.

Attention !!!

Buddeberg GmbH disclaims any liability arising from modifications to the magnetic stirrer couplings as described above without prior consultation and written agreement of Buddeberg GmbH.

4. Safety instructions

- The range of application of the magnetic stirrer couplings are to be found in the technical data sheet of these operating instructions and on the type label.
- Standard magnetic stirrer couplings are not be used in potentially explosive atmospheres.
- Magnetic stirrer couplings need to be separated from the drive motor before changing the stirring rotor.
- Magnetic coupling and drive motor need to be connected with a suitable flexible coupling.
- Repair may only be carried out by properly-qualified specialist personnel.
- Only original Buddeberg replacement parts may be used.

5. Maintenance

- Before starting any maintenance work, disconnect the magnetic stirrer coupling from stirring motor and vessel.
- Models with thread connection should remain screwed in the lid to avoid damages to the sealing during reinstallation when cutting rings are used.
- Check the bearings of drive shaft and output shaft in regular intervals.
- Clean the interior from product residues after stirring.
- According to the type, check O-rings and gaskets for visible damage.
- Failure to use original spare parts will invalidate the guarantee.
- Repairs may only be carried out by trained personnel. In case of any questions please contact Buddeberg GmbH or an authorised distributor.

6. Fault diagnosis

Deterioration in performance of the magnetic stirrer couplings may be due to the following:

- Damaged bearings.
- Soiling of the interior by product residues.
- Damaged sealing.
- Magnets damaged by hydrogen.

7. Technical data

Please refer to the technical data sheet in appendix 1 of these operating instructions. For customised versions please refer to the type label and/or supplied documentation.

8. Accessories

Accessories for magnetic stirrer couplings may be found on the list of accessories in appendix 2.

Appendix 1: Technical data sheet for magnetic stirrer couplings

Appendix 2: List of accessories for magnetic stirrer couplings

PTFE lip seals for glass flanges

For use in glass reactors to seal two all-glass flanges or glass on metal flange. Suitable for up to 10 bar. Single collar seals are recommended for the use with magnetic stirrer couplings. Double collar recommended for sealing two glass flanges.

Lip seal with 1 collar
